Art Unit: 2128

DETAILED ACTION

1. Claims 1-14 have been presented for examination based on applicant's disclosure filed on 17 December 2001. Claims 1-14 are rejected by the examiner.

Drawings

2. The drawing Figure 3B is objected to because the sectional portion of the drawing is not correctly referenced to Figure 3D. Corrective action is required.

Priority

3. Applicant's claim for priority based on continuation of U.S. Application No. 90/442,877 (now U.S. 6,470,304) filed 18 November 1999 is acknowledged.

Specification

4. The disclosure is objected to because of the following informalities:

The "means for" language recited on page 7 lines 7-10 of the specification is improper and does not provide the necessary enablement for the claimed subject matter. Appropriate correction is required.

Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Art Unit: 2128

5. Claims 1-14 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the enablement requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention.

Page 3

Specifically, independent claims 1 and 12 include limitations relating to the memory core having a "depth that is defined by a plurality of words" and "a word width that is defined by multiple pairs" of bitlines but no specific description of how the depth is defined by the word, or how a word width is defined by multiple pairs of bitlines is given. While page 6, lines 10, 21, and page 7, line 7 of the specification make reference to "a memory core having a depth that defines a plurality of words, and a word width that is defined by multiple pairs" (of bitlines), there is no specific definition or format given that describes the relationship between the claimed word and the memory core "depth", or the claimed word width and the multiple pairs of bitlines. Figures 1-10 do not cure this deficiency. Further, the "means for" language recited on page 7 lines 7-10 of the specification is improper and does not provide the necessary enablement for the claimed subject matter. (see objection to the specification above) Accordingly, a skilled artisan would not know how to make and/or use the claimed invention from the description contained in the specification.

Art Unit: 2128

Double Patenting

A rejection based on double patenting of the "same invention" type finds its support in the language of 35 U.S.C. 101 which states that "whoever invents or discovers any new and useful process ... may obtain <u>a</u> patent therefor ..." (Emphasis added). Thus, the term "same invention," in this context, means an invention drawn to identical subject matter. See *Miller v. Eagle Mfg. Co.*, 151 U.S. 186 (1894); *In re Ockert*, 245 F.2d 467, 114 USPQ 330 (CCPA 1957); and *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970).

A statutory type (35 U.S.C. 101) double patenting rejection can be overcome by canceling or amending the conflicting claims so they are no longer coextensive in scope. The filing of a terminal disclaimer <u>cannot</u> overcome a double patenting rejection based upon 35 U.S.C. 101.

6. Claims 1-11 are rejected under 35 U.S.C. 101 as claiming the same invention as that of claims 1-11of prior U.S. Patent No. 6,016,390. This is a double patenting rejection.

For example, the claimed limitations of independent claim 1 of the present invention are identical to claim 1 of U.S. 6,016,390 with the exception of the term "six transistor" in the second and third limitation of the claim. The examiner asserts that, since the term "six transistor" is used in limitation four of the claim (i.e. "arranging a six transistor core" design), it is implied that the "designing" of the core cell and flipped core recited in previous limitations are in fact based on a six transistor design. Therefore, the limitations independent claims 1 of the present invention are <u>identical in function</u> to the limitations of independent claim 1 U.S. 6,016,390. Dependent claims 2-11 are similarly identical with the corresponding claims of U.S. 6,016,390.

Art Unit: 2128

Double Patenting

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970);and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

7. Claims 12-14 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 26-29 of U.S. Patent No. 6,016,390.

Although the conflicting claims are not identical, they are not patentably distinct from each other because claims 26-29 of U.S. 6,016,390 are drawn to the same limitations as claims 12-14 of the present invention. These include:

- memory core having depth defined by words
- word width defined by pairs (global/complementary) of bitlines
- designing core cell global/complementary bitlines
- designing flipped core cell with global/complementary bitlines
- arranging six transistor core cell followed by flipped core cell pairs

The examiner notes that the claimed limitations of independent claim

Art Unit: 2128

12 of the present invention, are <u>nearly identical</u> in verse, and appear to be functionally equivalent to the limitations of independent claims 26 and 29 of U.S. 6,016,390.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 8. Claims 1-14 are rejected under 35 U.S.C. 103 as being unpatentable over US Patent 5,999,482 issued to Kornachuk et al in view of US Patent 6,043,562 issued to Keeth.

<u>Independent claims 1 and 12 are drawn to memory device design method with reduced bitline offset by:</u>

- memory core having depth defined by words
- word width defined by pairs (global/complementary) of bitlines
- designing core cell with global/complementary bitlines
- designing flipped core cell with global/complementary bitlines
- arranging six transistor core cell followed by flipped core cell pairs

Per independent claims 1 and 12: Kornachuk discloses the elements of the claimed limitations of the present invention as follows:

- memory core having depth defined by words: Kornachuk teaches a memory core design having a model wordline defining the memory core configuration. (Abstract, Summary of Invention, CL4-L1-23, 40-64, Figs. 2-3) Since the specification for the present invention gives no formal definition for the claimed word and word width

Art Unit: 2128

limitations (see 112(1) rejection), the examiner has equated the model wordline of Kornachuk to be functionally equivalent to the word and word width definitions of the present invention.

- word width defined by pairs (global/complementary) of bitlines: Kornachuck discloses **globally** addressable core cells (CL4-L14-23, CL7-L4, Fig. 7) and complementary bitlines (CL5-L39, Fig. 3) and defining a model wordline of the memory core configuration (CL4-L1-23, 40-64, Figs. 2-3).
- <u>designing core cell with global/complementary bitlines</u>: Kornachuk discloses <u>globally</u> <u>addressable</u> core cells (CL4-L14-23, CL7-L4, Fig. 7) and complementary bitlines (CL5-L39, Fig. 3).
- <u>designing flipped core cell with global/complementary bitlines</u>: Kornachuk discloses <u>globally addressable</u> core cells (CL4-L14-23, CL7-L4, Fig. 7) and complementary bitlines (CL5-L39, Fig. 3) connected to inverted (flipped) transistor core. (Figs. 3-5)

Kornacheu does not explicitly teach arranging a core cell followed by a flipped six transistor core cell. (although the examiner notes that Figure 5A of Kornachuck discloses a six transistor core cell)

Keeth discloses a semiconductor memory technique with multiple layers and offset conductive levels with cross coupled transistor pairs in the reduction of physical size. (abstract, Fig. 7, 30, 31,33, Detailed Description CL4-L55, CL5-L3) Keeth also discloses a memory core design having a model wordline defining the memory core configuration (Figs. 9-19, Tables 1-11) but also teaches arranging six transistor core cell

Art Unit: 2128

followed by flipped (complementary) core cell pairs. (Abstract, Summary of Invention, CL2-L15, CL4-L35-55, CL7-L29-31, Figs. 7, 9-19)

It would have been obvious to one having ordinary skill in the art at the time the claimed invention was made to modify the teachings of Kornachuk relating to memory core design having a model wordline defining the memory core configuration and complementary bitlines, with the teachings of Keeth relating to arranging a six transistor with complementary core cell pairs, to realize the claimed invention. An obvious motivation exists since this area of technology is highly competitive with many types of memory core cell designs available in the market place and large amounts of money being spent in product development and improvement. (see Keeth Background, for example) Accordingly, a skilled artisan would have made an effort to become aware of what capabilities had already been developed in the market place and, hence, would have been motivated to modify the teachings of Kornachuk with the teachings of Keeth in order to reduce development time and cost.

Regarding dependent claims 2-11, 13, and 14: In addition to the limitations already addressed above, dependent claims include additional limitations which are disclosed in the prior art (Keeth) as follows:

- complementing (flipping) the core about Y-axis: (Keeth: CL6-L67. Figs. 9, 10)
- complementing (flipping) the core about X-axis: (Keeth: CL7-L3, Figs. 9, 10)

Art Unit: 2128

Conclusion

9. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure, careful consideration should be given prior to applicant's response to this Office Action.

U.S. Patent 6,288,969 issued to Gibbins et al teaches high-speed asynchronous memory with current sensing amplifiers.

U.S. Patent 5,748,547 issued to Shau teaches high performance embedded semiconductor memory devices with multiple dimension first level bit lines.

U.S. Patent 5,179,538 issued to Pang et al teaches six transistor core cell memory with current sensing amplifiers.
